Title of Ph.D. Thesis: “Study of the influence of smear zone around sand compaction pile on properties of composite ground.”

Supervisor: Prof. A. Juneja, Deptt. of Civil Engg. IIT Bombay

Detailed report on the thesis: (Comment on the salient features of the work reported in the thesis and the basis of the recommendations -

This is an excellent Ph.D. thesis. Using laboratory analysis that includes CU tests with pwp measurements, as well as the use of SEM and XRD analyses on homogeneous samples of clay and in composite samples of clay and sand (SCP), the thesis clearly explains why the use of SCP improves the compressive strength of clays. It also clarifies and explains how the use of SCP causes smear zones that influences how excess pore water pressures develops and relaxes around sand columns in the clay. The thesis also explain the changes in fabric that the clay surrounding the SCP experienced during the compressive loading of the clay-sand composite.

The thesis is also important because it explains why the use of SCP works in the field.

In summary, the thesis is a very impressive piece of work that gives its author a deserved Ph.D. degree.
